1 **Let G be a compact Lie group. Show that G admits a bi-invariant metric, i.e., both right and left translations are isometries. *Hint:* Fix a left invariant metric g_L and a volume form $\omega - \sigma^1 \wedge \cdots \wedge \sigma^n$ where σ^i are left invariant 1-forms. Then define g as the average over right translations:**

$$g(v, w) = \frac{1}{\int \omega} \int g_L(DR_x(v), DR_x(w))\omega.$$

2 **Consider the upper-half plane**

$$\mathbb{R}^2_+ = \{(x, y) \in \mathbb{R}^2 \mid y > 0\}$$

with the hyperbolic metric

$$\frac{dx^2 + dy^2}{y^2}.$$

Show that the vertical line segment between $(0, 1)$ and $(0, 2)$ is the shortest path between these points.

3 **Consider $\mathbb{R}^2_+$ with the hyperbolic metric as above. Let $v_0 = (0, 1)$ be a tangent vector at the point $(0, 1)$ of $\mathbb{R}^2_+$. Let $v(t)$ be the parallel transport of v_0 along the curve $x = t$, $y = 1$. Show that $v(t)$ makes an angle t with the direction of the y-axis, measured in the clockwise sense.**

4 **For any $p \in (M, g)$ and orthonormal basis $e_1, \ldots, e_n$ for T_pM, show that there is an orthonormal frame $E_1, \ldots, E_n$ in a neighborhood of p such that $E_i = e_i$ and $(\nabla E_i)|_p = 0$. *Hint:* Fix an orthonormal frame $\overline{E}_i$ near $p \in M$ with $\overline{E}_i(p) = e_i$. If we define $E_i = \alpha_i^j \overline{E}_j$, where $[\alpha_i^j(x)] \in SO(n)$ and $\alpha_i^j(p) = \delta_i^j$, then this will yield the desired frame provided that the $D_{e_k}\alpha_i^j$ are appropriately prescribed.**

5 **For any point p in a Riemannian manifold (M, g), show that there exist coordinates $x^1, \ldots, x^n$ near p such that $\partial_i = e_i$ and $\nabla \partial_i = 0$ at p.**
